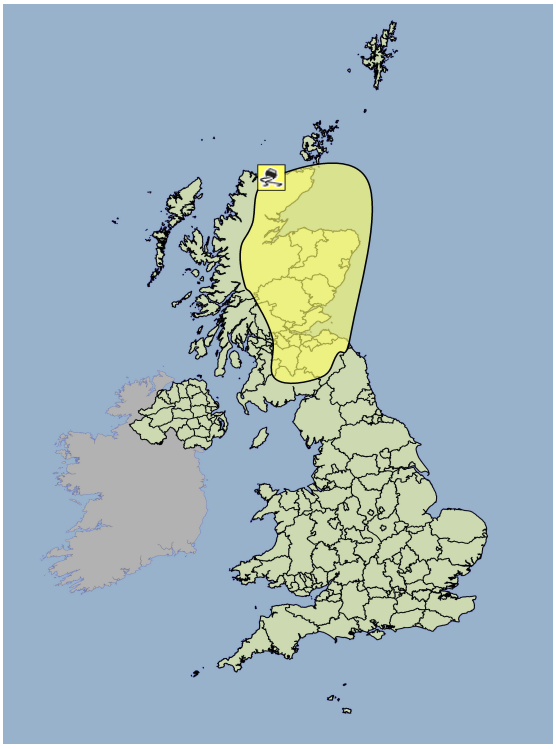
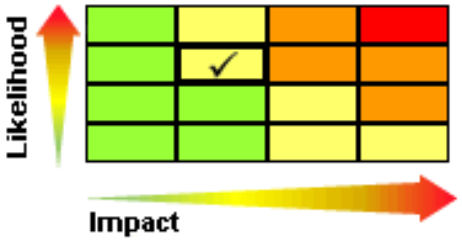
National Severe Weather Warning Service





Chief Forecasters Assessment
The deep area of low pressure passing close to northern Scotland on Monday and Tuesday brings cold air and frequent wintry showers across much of the northern half of the UK. Though the risk of snow accumulations will become confined largely to higher ground by Monday evening, there remains the risk of some ice and snow disruption on high-level routes. At lower levels, some icy patches are still possible, though the strong winds should prevent many roads from freezing.

The Met Office have issued a **Yellow Warning** of **Ice**

Valid from **18:00 on Mon, 23rd Feb 2015** until **11:00 on Tue, 24th Feb 2015**

Ice will form on untreated surfaces this evening and overnight, particularly after showers. These showers will be wintry over higher routes with 1-3cm of snow possible above 300m. Winds will also be strong at times, with gusts 50 to 60mph likely, mainly through the central belt, over bridges and higher routes.
The public should be aware of hazardous driving conditions and the risk to disruption to travel.
